

Storage Tank and Float Switch arrangement with 2 Way Float Switch

When Upper Water level reaches half the height of the Float, the Micro switch gets Open and the Water Pump gets disconnected from the Power Supply. The switch remains Open until the water level drops to half the height of the lower Float.

When Lower Water level reaches half the height of the Float, the Micro switch gets Closed and the Water Pump gets connected to the Power Supply. The switch remains Closed until the water level reaches half the height of the upper Float.
